

# Release Notes - February 2022

Published on 06/27/2022

## **Watermark automatically applied when the asset is marked as 'blocked for download'**

With this new feature, we provide a way to automatically apply a watermark to all assets that are marked as 'blocked for download'. This will allow users (with the rights to edit assets and Copywrite assets) to add watermarks to assets in batch actions. But be aware that watermarks can not be removed using the action bar as they can only be removed in the asset detail view of a single asset.

Contact your Customer Success Manager to activate this feature in your environment.

## **Add permissions to be excluded from blocked for download**

Marking an asset as 'blocked for download' can now be extended with additional permissions to exclude the block for download. Any user with the same permission(s) is able to download the asset despite it being blocked for download.

**Contact your Customer Success Manager to activate this feature in your environment.**

## **The right to download assets without the applied watermark**

As a user who can apply/remove a watermark, you now have the possibility to strip the watermark from the asset when downloading it if the asset has a watermark applied to it. You don't need to manually remove and add it back after I downloaded the asset.

## **Add (hyper)link field type to the template builder and Create + Publish**

InDesign has the option to create and assign hyperlinks to template elements. The template builder has been improved and can now recognize the hyperlinks. Once the hyperlink is added to the template as a new template field and the template has been synced to Lytho, it will appear as an additional template input field in Create + Publish where users can edit the URL of the hyperlink.

Hyperlinks are only enabled in pdf outputs when the pdf is generated with job options that are configured correctly.

### **Sort assets and collections by name**

A new sorting option has been added Assets and Collections. It is now possible to sort your search results in alphabetical order.

### **Collection share real-time sync**

Shared collections used to exist of the set of assets that were in the collection at the point in time the collection was shared. The disadvantage of this was that changes made to the collection wouldn't affect the assets shown to the share link so it would be out of sync when assets were added or removed after sharing the link. From this release, shared collections are automatically synced when changes are made to the original collection.

### **List view for assets**

The assets in the asset manager were displayed in grid view where only the asset previews are visible and asset details used to be one or more clicks away. Therefore, the list view for assets was a much-requested feature. We're happy to have implemented the option for a user to switch between grid view and list view. Also, every single user has the option to configure the columns of the list view to match their needs.

### **Show an icon to assets that are linked to one or more quitclaim documents**

With this icon, you can see at a glance if an asset is linked to one or more quitclaim document(s). You won't have to open the asset detail view anymore which saves you a lot of clicks when checking multiple assets.

### **Show a warning when leaving or refreshing your browser when an upload hasn't finished yet**

Uploading large assets or many assets at once may take quite some time to be finished. To make sure that all assets are being uploaded correctly it is important to leave your browser open and not to leave Lytho. A warning has now been introduced to remind users that uploads haven't been processed correctly yet, and it's not recommended to close or leave the page.

Don't worry about terminating your upload when working in Lytho. The upload will continue as long as you're not leaving Lytho.
